

**Appendix B. Statistical results tables from Year-long analysis B1, Seasonal analyses B2, and seasonal contrasts between mixes B3.**

TABLE B1. Summary table for year-long analyses for each study region. Models with interactions were compared to reduced models lacking interaction using *F* tests (Gaussian response variables) or likelihood ratio tests (for Poisson response variables). The best model was then used as a starting point for testing effects with marginal *F* tests or likelihood ratio tests as presented in the table.

TABLE B3. Summary table of planned contrasts between different mixes. Contrasts performed for each sample round (seasonal sample) separately. See Figure 3 and Appendix E. Response variables are, B3.1 = floral area, B3.2 = wild bee abundance, B3.3 = wild bee richness. Positive coefficient values indicate greater value for the first term of the contrast, negative coefficient values indicate a greater value for the second term.
